Github links

Main repository: <https://github.com/maja669e/portfolio>

Main Deployment page: <https://maja669e.github.io/portfolio/>

Bootstrap: <https://maja669e.github.io/portfolio/bootstrap/>

Bulma (using SASS): <https://maja669e.github.io/portfolio/bulma/>

Tailwind: <https://maja669e.github.io/portfolio/tailwind/>

Weighted Comparison Matrix

For my matrix, I have used following scales:

Weight scale:

5 = Very high importance
 4 = High importance
 3 = Medium importance
 2 = Low importance
 1 = Very low importance
 0 = Not relevant

Score scale:

5 = Excellent
 4 = Good
 3 = Acceptable
 2 = Weak
 1 = Poor
 0 = Does not satisfy

Criteria	W	BS S	BS W*S	TW S	TW W*S	Bulma S	Bulma W*S	Note
Responsive	5	3	15	3	15	4	20	App being mobile responsive
Customizable	4	3	12	3	12	4	16	Easy to customize your design
Learning curve	3	4	12	4	12	4	12	How easy to learn
Easy to use	4	5	20	2	8	2	8	How easy to use
Setup	3	5	15	3	9	3	9	Setup time
TOTAL			<u>74</u>		<u>56</u>		<u>65</u>	

From the results above, I can conclude that Bootstrap is the framework that fits my work style and benefits me the most. I can conclude from my own experience after working with all 3 frameworks, is that the results fit my own experience very well.

Bootstrap was easy to set up, had all the needed functionality for my project, and very easy to work with. Since this was a very small project, I haven't run into design limitations using Bootstrap, which I have heard could be an issue because it's components can look very default styled. In that case, I would consider using Bulma, as I found it easy to customize with CSS.

Bulma and Tailwind were a little more complex to set up. Bulma also needed some custom CSS to make the design look more alike, and Tailwind needed some extra steps for the deployment to work.

I also tested all 3 frameworks on phone, and had the best experience with Bulma regarding responsiveness.

Working with the frameworks

Working with each of the frameworks, the main difference for me was the setup and the usage of their classes. The usage of their classes is very similar, but the class names are different. For example, centering text looks a little different.

In Bootstrap:

```
<footer class="py-3 bg-dark text-center">
```

In Bulma:

```
<footer class="has-background-dark has-text-centered py-4">
```

For further usage, I would choose to work with either Bootstrap or Bulma.

Both Bootstrap and Bulma support Sass variables that can be customized before the framework's CSS is compiled. Tailwind takes a different approach, where styling is primarily built using utility classes and theme customization.

Usage of AI

I have also been using AI during the development of all three applications.

It has been used for design adjustments and implementation.

Since I struggled with understanding the sizing of rows and columns, I used AI to help me size the elements to fit the design I had in mind.

The example below is from Bootstrap, but I got help with this during the development of all three frameworks.

```
<div class="col-md-6">
  <h2>About Me</h2>

  <p>
    I am a web development student with
    user-friendly and visually appealing
    learning new technologies and improving
    frontend and backend development.
  </p>

  <div class="mt-4">
    <div class="mb-2">
      <strong>Want to see what I'm working on?</strong>
    </div>
  </div>
</div>
```
